

chapter 3

Introduction to R plot

Instructor: Li, Han

Contents

- ❑ creat/save a plot
- ❑ symbol, line and color
- ❑ title and range
- ❑ text and mtext
- ❑ add lines
- ❑ legend
- ❑ combine multiple plots

Why plot?

When we analyze data, the first thing is to look at the data, and check its patterns, for example,

- ❑ the range of the data
- ❑ symmetric or left, right skew?
- ❑ the most common values
- ❑ any outlier?

data example

	mpg	cyl	am
Mazda RX4	21.0	6	1
Mazda RX4 Wag	21.0	6	1
Toyota Corolla	33.9	4	1
Merc 280C	17.8	6	0
Ford Pantera L	15.8	8	1
Ferrari Dino	19.7	6	1
...

Example 1

```
attach(mtcars)
```

```
plot(wt, mpg, col=1)
```

```
abline(lm(mpg~wt), col=2)
```

```
title("Regression of MPG on Weight")
```

```
detach(mtcars)
```

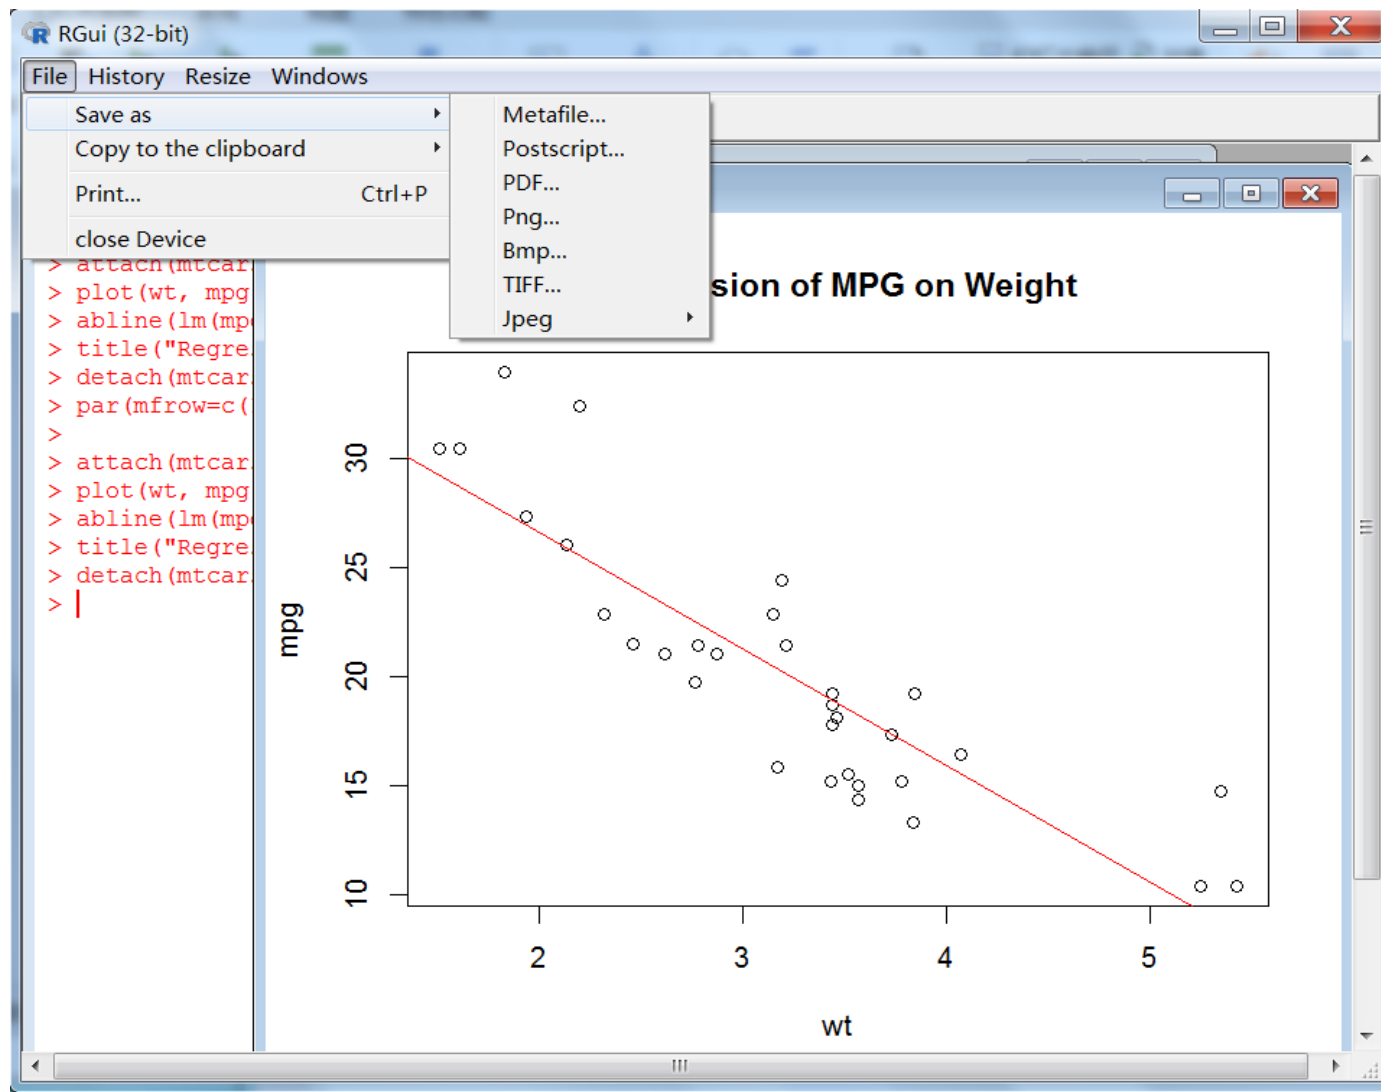

Regression of MPG on Weight

Create a plot

To create a plot, there are two methods:

- ❑ directly plot, then save it under the graphics window, by clicking file -> save as -> choose the graph type
- ❑ start a device, then plot, after that close the device

Example 2

```
jpeg("mygraph.jpeg")  
attach(mtcars)  
plot(wt, mpg, col=1)  
abline(lm(mpg~wt), col=2)  
title("Regression of MPG on Weight")  
detach(mtcars)  
dev.off()
```

Open multiple graph windows

In R, it will open one graph window by default. To open multiple graph windows, use

```
#make a new plot
```

```
dev.new()
```

```
#make another new plot
```

```
dev.new()
```

A simple plot

Example 3

```
dose <- c(20, 30, 40, 45, 60)
```

```
drugA <- c(16, 20, 27, 40, 60)
```

```
drugB <- c(15, 18, 25, 31, 40)
```

```
plot(dose, drugA, type="b")
```

Graph parameters

In R, we could set the parameters of `par()` to make a plot, for instance, the type and the color of a line, the size of the graph.

To save the original graph parameters, use `opar <- par(no.readonly=TRUE)`. After finishing the plot, reset the parameters to their original values by using `par(opar)`.

Example 4

```
opar <- par(no.readonly=TRUE)
par(lty=2, pch=17)
plot(dose, drugA, type="b")
par(opar)
```

Symbol and line

The parameters for setting the type and magnitude of symbol and lines are

- `pch=?` the type of a symbol
- `cex=?` the magnitude of a symbol
- `lty=?` the type of a line
- `lwd=?` the width of a line

Example 5

```
plot(dose, drugA, type="b", lty=3, lwd=3, pch=15,  
cex=2)
```

col

To specify the color for plotting, set col=?

We use set col="red", col="black", col="blue" or col=1, col=2,....

Other color parameters:

col.axis, col.lab, col.main, col.sub

Size of a graph

- $\text{pin} = c(a, b)$: size of a graph in inch with $\text{width} = a$, $\text{height} = b$
- $\text{mai} = c(a, b, d, f)$: the marginal size of a graph in inch, with $\text{bottom} = a$, $\text{left} = b$, $\text{up} = d$, $\text{right} = f$

Example 6

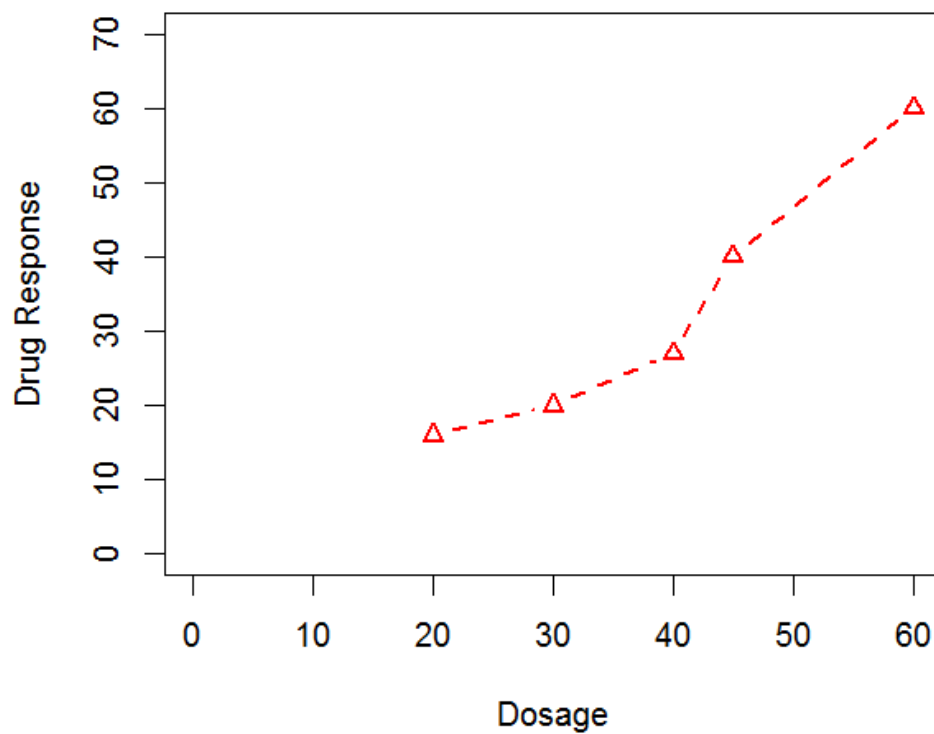

```
opar <- par(no.readonly=TRUE)
par(pin=c(2,3))
par(lwd=2, cex=1.5)
par(cex.axis=0.75, font.axis=3)
plot(dose, drugA, type="b", pch=19, lty=2, col="red")
dev.new()
plot(dose, drugB, type="b", pch=23, lty=6, col="blue",
bg="green")
par(opar)
```

title and range of plotting

Example 7

```
plot(dose, drugA, type="b", col="red", lty=2, pch=2,
lwd=2, main="Clinical Trials for Drug A", sub="This
is hypothetical data", xlab="Dosage", ylab="Drug
Response", xlim=c(0, 60), ylim=c(0, 70))
```

Clinical Trials for Drug A

This is hypothetical data

Add lines

To add lines to the graph, there are several methods:

- ▣ `abline(h=yvalues, v=xvalues, col=?, lty=?)`
- ▣ `lines(x,y, col=?, lty=?)`

Example 8

```
plot(dose, drugA, type="b", pch=19, lty=1,  
col="red")
```

```
abline(h=40,v=c(35, 50), col=2)
```

```
lines(dose, drugB, lty=2)
```

legend

When we have multiple lines in a graph, we need to use legend to tell their specific information to distinguish them.

`legend(location, title, legend, lty, col,...)`

Example 9

```
plot(dose, drugA, type="b", lty=1, col="red",  
ylab="Drug")
```

```
lines(dose, drugB, lty=2)
```

```
legend("topleft", title="Drug type", legend=c("Drug  
A", "Drug B"), lty=c(1,2), col=c("red",1))
```

text()

To add text in specific location, use

`text(location, "text to write", pos,...)`

`mtext("text to write", side, line,...)`

Example 10

```
attach(mtcars)
```

```
plot(wt,mpg)
```

```
text(wt,mpg, row.names(mtcars), cex=0.6, pos=4,  
col="red")
```

```
mtext("Cars", side=4, las=2, line=0.5)
```

```
detach(mtcars)
```

Combine multiple plots

If we would like to show multiple plots together, we need to specify the number of plots and how to place them.

We will draw $m \times n$ plots, row by row
`par(mfrow=c(m,n))`

We will draw $m \times n$ plots, column by column
`par(mfcol=c(m,n))`

Example 10

```
par(mfrow=c(2,2))  
plot(dose, drugA, type="b", lty=1, col="red",  
ylab="Drug")  #plot 1  
plot(dose, drugA, type="b", lty=1, col="red",  
ylab="Drug")  #plot 2  
hist(drugA)  #plot 3  
hist(drugB)  #plot 4
```

layout()

Example 11

```
layout(matrix(c(1,1,2,3), 2,2, byrow=T),  
widths=c(2,2), heights=c(3,3))
```

```
plot(dose, drugA)
```

```
plot(dose, drugB)
```

```
plot(drugA, drugB)
```

Try the examples and enjoy plotting!
